CONTENTS

Preface *page* xiii

1 INTRODUCTION AND PRELIMINARIES 1

1.1 The topics to be discussed 1

1.2 Equilibrium and departures from it 3

1.3 The equations of motion and various approximations 6

1.4 Basic parameters of heterogeneous flows 11

2 LINEAR INTERNAL WAVES 14

2.1 Waves at a boundary between homogeneous layers 14
Progressive waves in deep water, 15; Waves between layers of finite thickness, 18; Standing waves, 19

2.2 Waves in a continuously stratified fluid 21
Description in terms of modes, 22; Description in terms of rays, 24; Laboratory experiments on waves in bounded regions, 29

2.3 Waves in a moving stratified fluid 31
Velocity constant with height, 31; Lee waves with varying properties in the vertical, 34; Reversals of velocity and critical layers, 37

2.4 Weak non-linearities: interactions between waves 39
The mechanism of resonant interaction, 39; Interactions of interfacial waves, 41; Interactions with continuous stratification, 44

3 FINITE AMPLITUDE MOTIONS IN STABLY STRATIFIED FLUIDS 48

3.1 Internal waves of finite amplitude 48
Interfacial waves, 48; Cnoidal and solitary waves, 52; Waves and flows in a density gradient, 55; Finite amplitude lee waves, 58

Downloaded from https://www.cambridge.org/core. University College London (UCL), on 22 Aug 2018 at 08:24:42, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/CBO9780511608827

3.2 Internal hydraulics and related problems *page* 64
Steady frictionless flow of a thin layer, 64; Internal hydraulic jumps, 66; Flow down a slope, 68; The 'lock exchange' problem, 70; Gravity currents and noses, 72

3.3 Slow motions in a stratified fluid 76
The problem of selective withdrawal, 76; Blocking ahead of an obstacle, 79; Upstream wakes and boundary layers, 82; Viscous diffusive flows, 86

4 INSTABILITY AND THE PRODUCTION OF TURBULENCE 91

4.1 The stability of a free shear layer 92
The various types of instability, 92; The Kelvin–Helmholtz mechanism, 94; Interfaces of finite thickness, 97; Observations of the breakdown of parallel stratified flows, 102

4.2 The combined effects of viscosity and stratification 107
Viscous effects at an interface, 107; Thermally stratified plane Poiseuille flow, 108; Flows along a sloping boundary, 111; Transition to turbulence, 114

4.3 Mechanisms for the generation of turbulence 116
Classification of the various mechanisms, 116; Flows near boundaries, 118; Shear instabilities produced by interfacial waves, 120; The interaction between wave modes, 123; Internal instabilities with continuous stratification, 124

5 TURBULENT SHEAR FLOWS IN A STRATIFIED FLUID 127

5.1 Velocity and density profiles near a horizontal boundary 127
The logarithmic boundary layer, 128; The effect of a buoyancy flux, 130; Forced and free convection, 133; Constant-flux layers in stable stratification, 136

5.2 Theories of turbulence in a stratified shear flow 138
Similarity theories of turbulence and diffusion, 139; The spectrum of nearly inertial turbulence, 140; Arguments based on the governing equations, 145

5.3 Observations and experiments on stratified shear flows 151
The generation and collapse of turbulent wakes, 151; The suppression of turbulence at an interior shear layer, 154; Stratified flows in pipes, channels and estuaries, 157; Longitudinal mixing and advection, 161

Downloaded from https://www.cambridge.org/core. University College London (UCL), on 22 Aug 2018 at 08:24:42, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/CBO9780511608827

6 BUOYANT CONVECTION FROM ISOLATED SOURCES *page* 165

6.1 Plumes in a uniform environment 167
Axisymmetric turbulent plumes, 167; The entrainment assumption, 170; Forced plumes, 173; Vertical two-dimensional plumes, 176

6.2 Inclined plumes and turbulent gravity currents 178
A modified entrainment assumption, 178; Slowly varying flows, 180; Laboratory experiments and their applications, 181; Detailed profile measurements, 186

6.3 Thermals in a uniform environment 186
Dimensional arguments and laboratory experiments, 186; Buoyant vortex rings, 189; 'Starting plumes', 191; Line thermals and bent-over plumes, 192

6.4 The non-uniform environment 194
Motions in an unstable environment, 194; Plumes in a stable environment, 196; Forced plumes and vortex rings in a stable environment, 200; Environmental turbulence, 203

7 CONVECTION FROM HEATED SURFACES 207

7.1 The theory of convection between horizontal plates 208
The governing parameters, 208; Linear stability theory, 210; Finite amplitude convection, 211

7.2 Laboratory and numerical experiments on parallel plate convection 215
Observations of laminar convection, 216; Measurements at larger Rayleigh numbers, 219; Numerical experiments, 222

7.3 The interaction between convective elements and their environment 226
The formation of plumes or thermals near a horizontal boundary, 226; The environment as an ensemble of convection elements, 230; Convection from small sources in a confined region, 231; Penetrative convection, 234

Downloaded from https://www.cambridge.org/core. University College London (UCL), on 22 Aug 2018 at 08:24:42, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/CBO9780511608827

7.4 Convection with other shapes of boundary *page* 239
A heated vertical wall, 241; Buoyancy layers at vertical and sloping boundaries, 243; Convection in a slot, 246

8 DOUBLE-DIFFUSIVE CONVECTION 251

8.1 The stability problem 251
The mechanism of instability, 251; Linear stability analysis, 253; The form of the convection cells, 257; Finite amplitude calculations, 259

8.2 The formation of layers: experiments and observations 262
The 'diffusive' regime, 262; The 'finger' regime, 266; Side boundaries and horizontal gradients, 267; Related observations in the ocean, 270

8.3 The fluxes across an interface 273
Measurements in the 'diffusive' regime, 274; The time-history of several convecting layers, 278; Fluxes and structure at a 'finger' interface, 280; The thickness of a 'finger' interface, 283; Convection in a region of variable depth, 285

9 MIXING ACROSS DENSITY INTERFACES 288

9.1 Laboratory experiments 288
Stirring with oscillating grids, 288; Mixing driven by a surface stress, 292; The influence of molecular processes, 295; Comparison of various methods of stirring, 297

9.2 Geophysical applications 299
The wind-mixed surface layer, 299; Seasonal changes of a thermocline, 301; Mixing at an atmospheric inversion, 306; Other factors limiting the depth of a mixed layer, 310

10 INTERNAL MIXING PROCESSES 313

10.1 The observational data 313

10.2 Critical Richardson number criteria 317
Examples of equilibrium conditions, 318; Non-equilibrium conditions: step formation, 319; Energetics of a layered system, 322

Downloaded from https://www.cambridge.org/core. University College London (UCL), on 22 Aug 2018 at 08:24:42, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/CBO9780511608827

10.3 Wave-induced mixing *page* 325
Mixing at existing interfaces, 325; Formation of layers from a smooth gradient, 327; Statistical aspects of wave generation and breaking, 330; Waves and turbulence in large scale flows, 334
