

# SUBJECT INDEX

- absorption of energy at a critical layer, 38, 125, 327
- adiabatic lapse rate, 5
- amplitude dispersion, 48
- Antarctic
  - bottom water formation, 286
  - layering in stratified lake, 270
- atmosphere
  - convection in lower, 134, 227, 234, 306
  - effects of internal waves in, 124-6, 311, 325
  - observations of unstable layers in, 106, 327
- billow
  - clouds, 106
  - turbulence, 122, 325
- Bjerknes' theorem, 8
- blocking, 58, 66, 79-81
- boundary layer, logarithmic, 128-30
  - effect of a buoyancy flux, 130-8, 301-9
- Boussinesq approximation, 9-10, 24, 165
- bubble breakwater, 177
- buoyancy frequency, 11, 22, 25, 197
- buoyancy flux,
  - effect on shear flow, 130-8, 155, 292, 301
  - from small source, 165-73, 231-4.
- buoyancy layer, 243, 247
  - relation to salt fingers, 282
- buoyancy subrange of turbulence, 143, 289
- buoyant convection, *see* convection
- buoyant vortex ring, 189-91, 200
- cellular convection, 208, 216
- clear air turbulence, 106, 122, 325-7
- clouds
  - billow, 106
  - models of convection in, 196
  - organization by shear, 216
- cnoidal waves, 53
- collapse of turbulent wakes, 151-4
- columnar modes, 33, 57
- compressible fluid, 4, 9
  - finite amplitude waves in, 11, 59
  - growth of wave amplitude with height, 37, 126
- concentration of energy, mechanisms for the, 125, 327
- confined region, convection in, 231-4
- constant flux layers, 130, 148
  - limit in stable stratification, 136, 321
- continuously stratified fluid, 21-9, 44, 55
  - instabilities of, 124
- convection
  - cellular, 208, 216
  - double-diffusive, 251-87, 358
  - forced and free, 133
  - from distributed sources, 207
  - from small sources, 165
  - in a pipe, 240
  - in confined regions, 231
  - in regions of variable depth, 286
  - large Rayleigh number, 213, 220, 227
  - penetrative, 235
  - over a horizontal plane, 208, 213
  - over ice, 236, 238
- convective mixing in the ocean and atmosphere, 270, 301, 306
- 'counter gradient' heat flux, 234
- critical layer absorption, 38, 125, 327
- critical Rayleigh number, critical Richardson number etc., *see under the name of the parameter*
- 'dead water', phenomenon of, 19, 156
- diffusion
  - effect of, on slow viscous flows, 86
  - effect of, on stability of heated layer, 208, 251
  - of pollutant in stratified shear flow, 139-40
- diffusive interface
  - defined, 253
  - experiments with, 262-5, 274

- dispersion relations for internal waves, 16, 25, 49–50
- dissipation of energy
  - in turbulent flow, 130, 136, 146
  - viscous, 44, 46, 104, 123
- diurnal heating cycle, 306, 314
- double-diffusive convection, 251–87
- drag, wave, 62
  - effective at great heights, 38, 327
  - on slowly moving body, 84
- drift of fluid particles produced by waves, 52
- dying away of wind, 155, 319
- eddy transport coefficients
  - in free convection, 135
  - in neutral conditions, 130
  - in stratified flow, 132
  - ratio in stable gradient, 138, 149, 157, 358
- Ekman layer
  - analogy with buoyancy layer, 243
  - limitation of surface mixing, 310
- energetics of a layered system, 322
- energy arguments
  - for mixing in a stratified fluid, 294, 323
  - modified by distortion of the interface, 296
- entrainment, turbulent
  - across density interfaces, 288–99
  - dependence of, on Richardson number, 179, 291, 294
  - mechanism of, 167
  - proportional rate of, into plumes 172, and thermals, 191
- entrainment assumption, 170–1
  - modification on sloping boundary, 179
- entrainment constant, 173, 177
- environment
  - as an ensemble of convection elements, 230
  - properties produced by convection from small sources, 231–4
- environmental turbulence
  - effect on thermals 203, and on bent over plumes, 205
- equations of motion of stratified fluid, 6, 22
  - Boussinesq approximation, 9, 25
  - exact equation for large amplitude flow, 55–6
- equilibrium of a fluid, 3–5
- equilibrium Richardson number, 137, 186, 318
- estuaries
  - buoyancy driven flow in, 163
  - mixing in, 157, 161
  - stratified flow in, 157
- estuary number, defined, 158
- Euler equations of motion, 6
- external mixing processes, 116, 288–309
  - ‘filling box’ model, 231–5, 307
- finger interfaces, 266, 280–4
- fingers, salt, 253, 258
  - effect of shear on, 285
  - planform of, 258, 282
- fine structure in observed density profiles, 271, 314
- finite amplitude convection, 211–15, 259–62
- finite amplitude waves, 48–63
- fluxes across a density interface
  - diffusive interface, 274, 358
  - finger interface, 280
  - produced by mechanical stirring, 288–92
- forced convection, 134
- forced plumes, 173–6
  - in stable environment, 200–2
- fossil turbulence, 316
- free convection, 134–5
- frequency, buoyancy or Brunt–Väisälä, 11
- friction velocity, 128, 294
- front of gravity current, 72, 178, 194
- Froude number
  - internal, defined, 12
  - critical, 33, 65, 74
- gas absorption into liquid surface, 297
- generation of turbulence, mechanisms for, 116–26
- gradient Richardson number, 12, 92, 100
- Grashof number, 112, 209, 241
- gravity current, steady turbulent, 178–85
  - nose at front of, 72, 178, 194
- grids, stirring with, 288–92
- group velocity, 16, 27, 32, 38
- heated wall
  - flow along a, 113, 241
  - formation of layers at, 264, 267

- heating a salinity gradient from below, 262–6
- heating of surface layer, effect on mixing, 301, 305
- Helmholtz equation, use in the lee wave problem, 56, 60
- horizontal gradients, layering due to, 267–70
- horizontal mixing in a stratified fluid, 317
- hydraulic jumps, internal, 66, 182
  - in atmosphere, 67, 119
- hydraulic theory for stratified flows, 64–75
- inflow into turbulent plumes, 169, 171
- instability of stratified fluid; *see* stability
- interactions, resonant, 39–47, 358
  - between interfacial waves, 41–4
  - between internal waves, 44–7
  - instabilities due to, 43, 123, 327
  - laboratory experiments, 45, 46, 328
- interfaces
  - density, 14, 64, 92
  - diffusive, 253, 262, 274
  - finger, 266, 280–4
  - fluxes across, due to double diffusive convection, 274, 280
  - mechanical mixing across, 288–92
  - stability of double diffusive, 279–80
  - stress across, 74
- interfacial waves
  - between deep layers, 16, 49; layers of finite thickness, 18, 50
  - observations in ocean, 19, 51, 120
  - shear instabilities produced by, 120–3, 325
- interior shear layer
  - stability, 92–107
  - suppression of turbulence by density gradient, 154–6
- internal heating, convection due to, 217
- internal mixing mechanisms, 116, 313–37
- internal waves
  - at a density interface, 14, 48
  - description in terms of modes, 22
  - description in terms of rays, 24
  - energy absorption at critical layers, 37, 125, 330
  - finite amplitude, 48–63
  - generated by convection, 37, 237, 311
  - generated by oscillating bodies, 28–31, 202, 359
  - mixing caused by, 120, 125, 325–34
  - momentum transported by 38, 327, solitary, 53
  - intrinsic frequency, 38
  - inverse method for lee wave calculations, 58
  - inversion, atmospheric, 5
  - mixing across, 306–9
  - isothermal atmosphere, 5, 24
  - katabatic winds, 69, 178
  - Kelvin–Helmholtz instability, 93–6, 106, 120, 318
  - Kolmogorov hypotheses, 141
  - laboratory experiments, *see entry under the name of the phenomenon*
  - lakes
    - mixing due to penetrating radiation, 306
    - salt stratified, 270
  - laminar convection between horizontal plates
    - observations of, 216–18
    - stability theory, 208–12
  - laminar convection between vertical plates, 241, 246–8
  - large density variations, 11, 59
  - lateral heating of salinity gradient
    - production of layers by, 264, 267–70
  - layers in a stratified fluid
    - formation by breaking internal waves, 122, 316
    - formation by heating salt gradient from below, 262–5
    - formation by salt finger convection, 266, 272
    - formation by side wall heating, 267–9
    - formation near sloping boundary, 268
    - observations in the ocean, 270–3, 313–17
    - time history and stability of, 278–80
  - lee waves
    - in the atmosphere, 34–6, 119, 327
    - in a channel, 33
    - in unconfined flows, 34
    - when velocity varies with height, 37–9, 327
    - with finite amplitude, 58–63
  - linearized equations of motion, 8
    - applied to internal waves, 15, 22
    - Boussinesq approximation, 10, 24

- lock exchange problem, 70–2
  - with both temperature and salinity differences, 269
- logarithmic velocity profile, 128–9
- log-linear profile, 131
- longitudinal mixing and dispersion, 161–4, 358
- mean field approximation, 224, 261
- mechanical mixing across fluid interfaces, 288–300
- microstructure measurements in ocean, 122, 271, 314–16, 358
- mixed layer
  - in the atmosphere, 306–9
  - in the ocean, 299–305
- mixing in a stratified fluid
  - at a density interface, 179, 288, 292
  - classification of mechanisms, 116–18
  - comparison of various experiments, 297–8
  - due to internal waves, 120, 125, 325–34
  - external mixing processes, 116, 288–309
  - internal mixing processes, 116, 313–37
  - produced by a surface stress, 292–5
- mode description of internal waves, 22
- molecular effects
  - on free convection, 214
  - on turbulent mixing, 295–7
- momentum transport by internal waves, 38, 327
- Monin–Obukov length, 131, 301
- mountain and valley wind, 243–5
- non-linear interactions
  - weak resonant, 39–46, 328
  - strong, relation to turbulence, 47, 118, 144, 335
- non-linear stability theory, 114, 212
- nose at front of gravity current, 72, 178, 194, 359
  - observations in atmosphere, 74
  - velocity of, 72–4, 194
- numerical experiments
  - on double-diffusive convection, 259–62
  - on internal wave breakdown, 329
  - on parallel plate convection, 222–5, 359
- Nusselt number, 209, 213, 224, 260
- observations in ocean and atmosphere
  - summary of recent, 313–17
  - suggestions for future, 335–7
- ocean
  - bottom water formation, 286
  - observations of layers in, 270–3, 313–17
  - observations of internal wave breakdown in, 122, 316
  - seasonal thermocline, 301–4
  - wind mixed surface layer, 299–300
- one-dimensional mixing assumption, 288, 317
- oscillating bodies, generation of waves by, 29–31, 202
- oscillating grid, stirring with, 289–92
- overstable mode of convection, 257
  - observations of, 263
- parameters used to describe stratified flows, definitions, 11–13
- parcel, open, 203, 230
- patches of turbulence, 118, 122, 316, 330
- Péclet number, 87, 209, 296
- penetrative convection, 235–9, 306
- pipes, stratified flow in, 157–61
- plumes, axisymmetric
  - behaviour near final height, 175, 199
  - bent over, 192–3
  - ensemble of, 230
  - forced, 173–6, 200–2
  - formation near horizontal boundary, 226–8
  - in closed region, filling box model, 232–4
  - in stable environment, 196–9, 358
  - in uniform environment, 167–73
  - in unstable environment, 194–6
  - mixing due to, against interface, 296
  - similarity solution for, 168
  - starting, 191
- plumes, two-dimensional
  - on a slope, 178–84
  - vertical, 176
- Poiseuille flow, stratified, 108–10
- potential density gradient, 5, 11
- potential temperature, 5
- Prandtl number, 13, 209
  - dependence of heat flux on, 219–20
- probability of wave breakdown, 330–1
- progressive waves at an interface, 15–19
- quadratic interactions, 40

- radiation of heat
  - effect on surface layer of atmosphere, 309
  - mixing due to, through sea surface, 305
- radiation of wave energy out of boundary layer, 237–311
- ray description of internal waves, 24
- Rayleigh number, salinity, 254–7
- Rayleigh number, thermal, 87, 209–13, 254
  - for marginal stability, 210
  - of boundary layer, 227
- Red Sea
  - circulation in, 163–4
  - layers at bottom of, 271
- reflection of internal waves
  - in the interior of a fluid, 27
  - at a boundary, 20, 28
- resonant interaction in a stratified fluid, 39–47
  - leading to interfacial instability, 44, 120–2, 325–6
  - leading to interior instability, 46, 328–9
- resonant trio, 40, 45, 123, 358
- reversal
  - of density gradient in convection experiments, 221–2, 234, 260
  - of gravity current by opposing flow, 184–5
  - of wind velocity, and critical layers, 37–9, 125, 327, 329
- Reynolds analogy, 130, 134
- Reynolds number, 13
  - effect of on breakdown to turbulence, 104, 324
  - effect of on mixing across an interface, 295
- Richardson number
  - comparison of definitions, 323
  - critical, for collapse of turbulence, 138, 152–6, for instability of shear layer, 92–102, 317, 325
  - equilibrium, 137, 186, 318
  - flux, 12, 133, 146–9, 160
  - gradient, 12, 97, 132
  - normal value on slope, 69, 181
  - overall, 12, 33, 179, 291, 294
  - pipe, 158–9
- roll cells, 211, 216, 220
  - finite amplitude calculations, 213, 222–5
- rotation, effect of on boundary mixing, 310
- rotors, 56, 62, 124, 327
- salt fingers, 253, 256, 282–3
  - observations of, 266, 272, 282
  - theory for steady state, 282–3
- salt fountain, 252
- saturation of wave energy in stratified fluid, 331–2
- scale height, 5, 24
- seasonal thermocline, 301–6
  - observations of, 303, 304
  - theoretical model of, 301–4
- seiche, internal, 20, 21
- selective withdrawal, 76–9, 88–9
- semiconvection, 279
- separation of flow over an obstacle, 63, 119
- sewage disposal, finger phenomenon, 272
- shadowgraph pictures of density gradients, 266, 282, 286
- shape of convection cells, 212, 216, 282
- shear, effect of on salt fingers, 285
- shear flow, turbulent stratified, 127–64
- shear instability
  - due to interfacial waves, 120–3, 325
  - laboratory studies of, 102–6, 359
  - of density interfaces, 92–107, 318
  - of flows near boundaries, 93, 112, 119
- ‘sheets’, splitting of in thermocline, 326
- side boundaries
  - effect on double-diffusive convection, 267–9
- similarity solutions
  - for plumes, 168
  - for slow stratified flows, 84, 85, 87–9
  - for thermals, 187
- slicks, as indicators of internal waves, 19, 358
- ‘slippery sea’, 156
- sloping boundary
  - breaking of internal waves against, 125
  - effect on double-diffusive convection, 268
  - hydraulic theory of flow down, 68–70
  - plume theory of flow down, 178–85
  - stability of flow along, 111–13
- slot, convection in, 246–50
- slow motions in a stratified fluid, 76–90

- solitary waves
  - internal, 52–3
  - on a transition layer, 54–5
- Soret effect, 263
- spectrum of turbulence,
  - inertial subrange, 141–2
  - with a density gradient, 143–4, 336
- spectrum of velocities produced by
  - internal waves, 331, 333
  - criteria to distinguish from turbulence, 335
- stable stratification, defined, 4
  - plumes rising through, 196–202
- stability
  - hydrostatic, 4
  - of double-diffusive systems, 253–7
  - of flow near a boundary, 93, 112, 119
  - of fluid layer heated from below, 210, 227
  - of internal shear layer, 92, 107
  - of salt fingers, 284
  - of series of layers, 279–80
- standing waves, 19–21
- starting plumes
  - axisymmetric, 191–2
  - two-dimensional, 194
- statistical theory of breaking internal waves, 330, 331
- step formation
  - by breaking internal waves, 122, 316
  - by double-diffusive mechanism, 262–6, 270–3
  - by mechanical mixing, 289, 315, 326
- stress, mixing driven by surface, 292–4, 300
- strong non-linear interactions, 47, 144
- subcritical flows, hydraulic theory, 33, 65–6
- superposition of waves, 328–336
- surface layer, wind-mixed, 299–300
- surface motions due to internal waves, 19
- surface waves, 1, 18
- Taylor column, analogy between
  - blocking and, 27, 80
- thermal turbulence, 250
- thermals,
  - axisymmetric, 186–9
  - flow into, 189
  - formation near boundary, 226–9
  - in stable environment, 200–2
  - line, 192–4
  - similarity solutions for, 187
- thermocline, 28, 299–306, 313
  - mixing across, 299–300
  - prediction of seasonal behaviour, 301–6
- thermohaline convection, 251
- tilted channel,
  - shear layer experiments in, 103–6
- time-dependent calculations
  - motion in a stratified fluid, 79, 90
  - stability of heated layer, 229
- Tollmien–Schlichting waves, 93, 109
- turbidity currents, 178
- turbulence
  - contrasted with waves, 334–6
  - intermittent, in stratified flows, 118, 138, 150, 158, 316, 322
  - mechanisms for generation of, 116–26
  - transition to, 114–15
- turbulent convection
  - between vertical plates, 249–50
  - over a horizontal plane, 134, 213, 220, 227–30
- turbulent stratified shear flow, 127–64
  - experiments in the laboratory, 151–61, 358
  - longitudinal dispersion in, 161–3
  - similarity theories for turbulent properties, 130–40
  - theories based on the governing equations, 145–50
- turbulent transport coefficients, effect of stability on ratio of, 138, 149, 157, 358
- turbulent wakes,
  - collapse of, 152–4
  - use in production of linear density gradient, 154
- unstable environment,
  - plumes in, 194–5
- upper bound on convective heat flux, 215
- upstream
  - boundary layers, 85–6
  - influence, 57, 66
  - wakes, 82–5
- variable depth, convection in region of, 285–7
- velocity profiles in turbulent flow over horizontal boundary, 128–36
- ventilation of mines, 159, 184
- vertical boundary
  - convection near heated, 241
  - stability of flow near, 242, 248–9

- virtual point source, 168
- viscosity
  - effect on mixing across interfaces, 295, 299
  - effect on stability of shear flow, 104
  - effect on turbulence in stratified fluid, 324
  - effect on waves, 31, 44, 295, 359
  - limitation on growth of resonant interaction, 46, 123, 328
  - limitation on thickness of layers in ocean, 330
- viscous flow in a density gradient
  - non-diffusive, 82–6
  - with diffusion, 86–90
- vortex ring, buoyant, 189–91
  - in stable environment, 200–2
  - mixing due to, against interface, 296
- vortex sheet, stability, of, 94–6
- vorticity
  - equation, 7
  - generation by density gradients, 8, 24, 222
- wakes
  - collapse of, 151, 153
  - generation of waves by, 152, 359
  - turbulent, 62, 119, 152
  - upstream, viscous, 82–5
  - viscous diffusive, 88
- waves
  - at an interface, 14–21
  - compared with turbulence, 334–6, 358
  - in a moving fluid, 31–9
  - in bounded regions, 29–31
  - shear instability produced by, 120–3, 325
  - transport of momentum by, 38, 327
  - see also* internal waves, lee waves, surface waves
- wedge
  - intrusion of salt, in an estuary, 74–5
  - waves in a, 28, 125
- wind
  - mixing in surface layer of ocean, 299–300
  - surface current produced by, 156
- withdrawal from stratified fluid
  - hydraulic method, 76–9
  - slow flow, 88–90
